

LinkForge Developer & Deployment Guide

Version 2.1 — Complete Architecture, Deployment Pipeline & GitHub Workflow

1. Understanding the Update Pipeline (Local PC → GitHub → VPS)

LinkForge follows a standard cloud deployment pipeline. Your VPS pulls its updates directly from your **GitHub repository**, not from your local computer. Therefore, code must be pushed to GitHub before your VPS can install it.

2. How to Update: Step-by-Step

Step 1 — Push Local Changes to GitHub (Run on Windows PC)

Whenever you or Antigravity complete modifications on your computer, run these 3 commands to push them to GitHub:

```
cd X:\.config\docker\linkforge
git add .
git commit -m "Update LinkForge features"
git push origin main
```

Step 2 — Apply the Update on Your VPS Server (2 Easy Methods)

Once the commit is on GitHub, you can update your VPS using either method below:

Method A (1-Click Web Update):

Open your VPS LinkForge dashboard in your browser (<http://100.64.194.104:5006>), go to **Settings** or **Admin**, and click **Update LinkForge**. The app will pull the latest commit and restart automatically.

Method B (VPS Terminal):

SSH into your VPS server and run:

```
cd /root/linkforge # (or your LinkForge directory on VPS)
git pull origin main
docker compose restart
```

3. New Features in Version 2.1

Feature	Description	Access URL
Book Vault	Search millions of titles, auto-grab from Shelfmark, 100% official covers from Hardcover.app, real-time download progress, and 1-click EPUB downloads.	/books
LinkForge Pulse	Real-time AI interest cluster synthesis and synchronized multi-source RSS intelligence streams.	/pulse
Full Backups v2.1	12-table SQLite export, offline article archives packaging, and complete downloaded EPUB library preservation.	/settings
Granular Nuke Tools	Selective data purging with dedicated Book Vault library and EPUB filesystem clean toggles.	/admin/nuke

4. 100% Privacy & Data Safety Guarantee

Your .gitignore configuration strictly excludes all SQLite databases (*.db), personal bookmarks, notes, login tokens, downloaded EPUB files, and cached web archives. Pushing code to GitHub will **NEVER** expose your personal data or credentials.
